

# VectorNet 3

## The third iteration of the European network for medical and veterinary entomology

William Wint

ERGO

Bologna Modelling workshop

Sept 18 and 19, 2024

# VectorNet

European Network  
for Medical and  
Veterinary Entomology

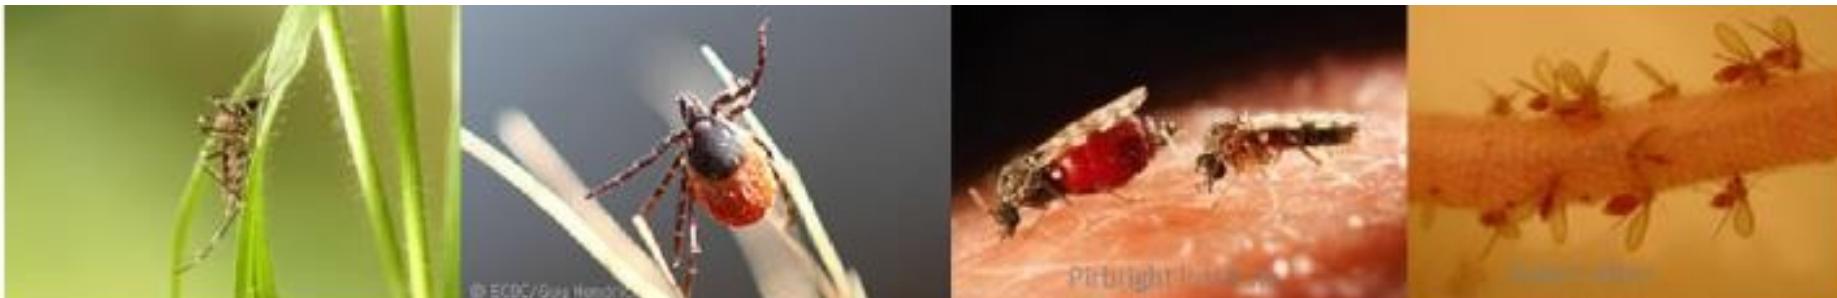

# What is VectorNet

A European network for sharing data on the geographic distribution, abundance and seasonality of arthropod vectors transmitting human and animal disease agents.

For and by medical and veterinary entomologists, public health professionals and veterinarians

A joint initiative of the European Food Safety Authority (EFSA) and the European Centre for Disease Prevention and Control (ECDC)

# VectorNet 3 Evolution

## Continuity

- ▶ Update the distributions
- ▶ Capacity building and training
- ▶ Scientific advice

## Update

- ▶ Build a new One-Health Vectornet Entomology Network (OH-VEN)

incorporating EFSA and ECDC

appointees

- ▶ Reintroduction of targeted field work

## New

- ▶ RCT for the (cost)-effectiveness of vector control methods
- ▶ Absences and gap analyses
- ▶ Database dissemination: upload the database to GBIF

# VectorNet in the Field

- ▶ All field studies will be informed by the species-specific habitat suitability modelling and a gap analyses
- ▶ Field studies will be designed to be compatible with and complementary to those conducted in VectorNet 1

## **3 types of field studies**

- ▶ Short-term, targeted entomological surveillance
- ▶ Longitudinal, targeted entomological surveillance studies
- ▶ Studies to establish the (cost)-effectiveness of vector control methods

# VectorNet Data Sept 23

A typical VN Map

# VectorNet Data for Modelers

## Targets

Ticks, Mosquitos, Sandflies, Biting Midges, ~ 40 Priority Species, > 340 Total

## Data

- Distributions
- Point and Polygon
- Numbers
- Sample Effort
- Absences

## Data sources

- Network
- Literature
- Field

## Outputs

- Maps
- Database

## Processes

**Expert Validation**

# VectorNet3 for Modelers

Database to be made more accessible and reliable

- ▶ Database to be cleaned
- ▶ More focus on point data
- ▶ Data to be enhanced -
  - absences (inferred and threshold limits),
  - gaps
  - surveillance activities
  - other data sources (OH national surveillance)
  - NB USP only Validated data?
- `
- ▶ Database to be more accessible
  - directly ?? via API
  - via GBIF
  - via Interactive Maps
  - via regular flat file and shapefile

# VectorNet3 Absences

Spatial and environmental -

climate thresholds, spatial inference.

Inferred from point data records - if record for 1, using particular method, then  
? infer zero for ones not reported

- a) Point Sampling effort sufficient
- b) Same sampling methods are effective for source species inferred
- c) Temporal and spatial activity patterns same
- d) minimum sampling periods within expected seasonal presence
- e) complete reporting/identification of all species in published reports confirmed -- would require retrospective validation of existing records . ? new lit records could be flagged with absence generation tags

# VectorNet unused Potential

Seasonality - first and last records

Absences already mentioned

Abundances (not density) - potentially In future

Spread - only if/when absences reliably inferred

Targeted surveillance

? Gold standard for Citizen Science
